2.8.Availability of information about the model:

All information in full detail is available

2.9.Availability of another QMRF for exactly the same model:

None to date

3.Defining the endpoint - OECD Principle 1

3.1.Species:

n/a

3.2.Endpoint:

2.Environmental fate parameters 3.Persistence: Biodegradation 2.3.a.Ready/not ready biodegradability

3.3.Comment on endpoint:

The half-life is the time required for the concentration of a substance to halve its original value in a particular environmental medium. The half-lives of organic compounds are among the most commonly used criteria for studying persistence [1]. The semi-quantitative data based on expert judgment and actual experimental values have already been suggested by Webster et al. [2] as preferable for half life identification, and are commonly used to develop the widely applied multimedia models [3,4]. In addition, a simple QSPR regression model has been demonstrated to be an useful tool for the identification and prioritization of existing or not yet synthesized potential persistent organic pollutants [5].

3.4.Endpoint units:

The half-life values (170-55000 h) were transformed into logarhitmic form for modelling.

3.5.Dependent variable:

log T(0.5)

3.6.Experimental protocol:

The dataset of structurally heterogeneous and highly representative of many classes of already defined problematic chemicals includes 250 organic compounds of known half-lives for transformation into sediment [6].

3.7.Endpoint data quality and variability:

Semiquantitative degradation half lives in sediment were organized in six half-life categories. Experimental data from different labs was used.

Statistics:
max value: 4.74
min value: 2.23
standard deviation: 0.741
skewness: 0.166

4.Defining the algorithm - OECD Principle 2

4.1.Type of model:

2D and 3D regression-based QSAR

4.2.Explicit algorithm:

multilinear regression QSAR
multilinear regression QSAR derived with BMLR (Best Multiple Linear Regression) method

log T(0.5) = 2.60
+0.968*Molecular density (AM1)
+0.138*Randic index (order 3)
-0.0620*HACA-1 (Zefirov)
-3.40*Polarity parameter (Zefirov)

4.3.Descriptors in the model:

[1]Molecular density (AM1) [g/(mol*mÅ3)] Molecular weight divided by molecular volume based on AM1 parameterized calculations
[2]Randic index (order 3) [unitless] Third order Randic molecular connectivity index
[3]HACA-1 (Zefirov) [Å2] Hydrogen bonding acceptor ability of the molecule based on Zefirov's charge distribution
[4]Polarity parameter (Zefirov) [au] Difference between most positive and most negative atomic charges based on Zefirov's charge distribution

4.4.Descriptor selection:

Initial pool of ~1000 descriptors. Stepwise descriptor selection based on a set of statistical selection rules (one-parameter equations: Fisher criterion and R2 over threshold, variance and t-test value over threshold, intercorrelation with another descriptor not over threshold),

(two-parameter equations: intercorrelation coefficient below threshold, significant correlation with endpoint, in terms of correlation coefficient and t-test)

Stepwise trial of additional descriptors not significantly correlated to any already in the model.

4.5.Algorithm and descriptor generation:

1D, 2D, and 3D theoretical calculations. Quantum chemical descriptors derived from AM1 calculation. Model developed by using multilinear regression.

4.6.Software name and version for descriptor generation:

QSARModel 4.0.4
QSAR/QSPR package that will compute chemically meaningful descriptors and includes statistical tools for regression modeling
Molcode Ltd, Turu 2, Tartu, 51014, Estonia
http://www.molcode.com

4.7.Chemicals/Descriptors ratio:

41.8 (167 chemicals / 4 descriptors)

5.Defining the applicability domain - OECD Principle 3

5.1.Description of the applicability domain of the model:

Applicability domain based on training set:

a) by chemical identity: diverse set of organic pollutants

b) by descriptor value range: The model is suitable for compounds that have the descriptors
in the following minimal-maximal range:
Molecular density (AM1): 0.808 - 2.37
Randic index (order 3): 0.00 - 10.3
HACA-1 (Zefirov): 0.00 - 11.0
Polarity parameter (Zefirov): 0.0384 - 0.324

5.2.Method used to assess the applicability domain:

Range of descriptor values in training set with ±30% confidence. Descriptor values must fall between maximal and minimal descriptor values of training set ±30%.

5.3.Software name and version for applicability domain assessment:

QSARModel 4.0.4
QSAR/QSPR package that will compute chemically meaningful descriptors and includes statistical tools for regression modeling
Molcode Ltd, Turu 2, Tartu, 51014, Estonia
http://www.molcode.com

5.4.Limits of applicability:

See 5.1

6.Internal validation - OECD Principle 4

6.1.Availability of the training set:

Yes

6.2.Available information for the training set:

CAS RN:Yes
Chemical Name:Yes
Smiles:No
Formula:Yes
INChI:No
MOL file:Yes

6.3.Data for each descriptor variable for the training set:

All

6.4.Data for the dependent variable for the training set:
All
6.5.Other information about the training set:
167 data points
0 negative values
167 positive values
6.6.Pre-processing of data before modelling:
n/a
6.7.Statistics for goodness-of-fit:
R2 = 0.820 (Correlation coefficient)
s2 = 0.319 (Standard error of the estimate)
F = 184 (Fisher function)
6.8.Robustness - Statistics obtained by leave-one-out cross-validation:
R2CV = 0.807
6.9.Robustness - Statistics obtained by leave-many-out cross-validation:
R2CVMO = 0.805
6.10.Robustness - Statistics obtained by Y-scrambling:
n/a
6.11.Robustness - Statistics obtained by bootstrap:
n/a
6.12.Robustness - Statistics obtained by other methods:
ABC analysis (2:1 training : prediction) on sorted (in increased order of endpoint value) data divided into 3 subsets (A;B;C). Training set formed with 2/3 of the compounds (set A+B, A+C, B+C) and validation set consisted of 1/3 of the compounds (C, B, A).
average R2 (fitting) = 0.822
average R2 (prediction) = 0.804

7.External validation - OECD Principle 4

7.1.Availability of the external validation set:
Yes
7.2.Available information for the external validation set:
CAS RN:Yes
Chemical Name:Yes
Smiles:No
Formula:Yes
INChI:No
MOL file:Yes
7.3.Data for each descriptor variable for the external validation set:
All
7.4.Data for the dependent variable for the external validation set:
All
7.5.Other information about the external validation set:
83 data points,
0 negative values,
83 positive values

7.6.Experimental design of test set:

From sorted source data, each 3rd was subjected to the test set.

7.7.Predictivity - Statistics obtained by external validation:

R2 = 0.744 (Coefficient of determination)

7.8.Predictivity - Assessment of the external validation set:

All are in range of applicability domain:

Molecular density (AM1): 0.766 - 2.22

Randic index (order 3): 0.00 - 9.21

HACA-1 (Zefirov): 0.00 - 10.7

Polarity parameter (Zefirov): 0.0384 - 0.326

7.9.Comments on the external validation of the model:

The validation coefficient of determination (R2) is signifficant and close to those coefficients of internal validation (R2CV and R2CVMO).

8.Providing a mechanistic interpretation - OECD Principle 5

8.1.Mechanistic basis of the model:

Topological descriptor "Randic index (order 3)" in the model represents compounds' size and branching. It is known that such topological descriptors behave similarly with hydrophobicity (logP) which particularly is related to compounds distribution in sediment. "Molecular density (AM1)" represents a compactness of compounds', hence cyclicalness, and most importantly the presence of heavier atoms, such as halogens. Cycles and halogens are making compounds more stable thereof the coefficient of the descriptor is positive. The other two descriptors coefficients are negative and they are decreasing the persistence. They are related to electrostatic interactions where "HACA-1 (Zefirov)" represents the strength of possible hydrogen bonding and "Polarity parameter (Zefirov)" represents the charge differences. Higher electrostatic interactions would lead to bigger reactivities.

8.2.A priori or a posteriori mechanistic interpretation:

a posteriori mechanistic interpretation, consistent with published scientific interpretations of experiments

8.3.Other information about the mechanistic interpretation:

Similar mechanistid interpretation provided in [5].

9.Miscellaneous information

9.1.Comments:

The data are gathered from handbook (Physical-Chemical Properties and Environmental Fate Handbook) which includes data from different sources. Therefore the experimental protocol cannot be provided. The data were also semiquantitatively classified as proposed by Mackay [2].
